

PHY138 – Waves, Lecture 8

Today's overview:

- Dispersion and Rainbows
- Lenses
- The Thin Lens Equation
- Lenses used in Combination

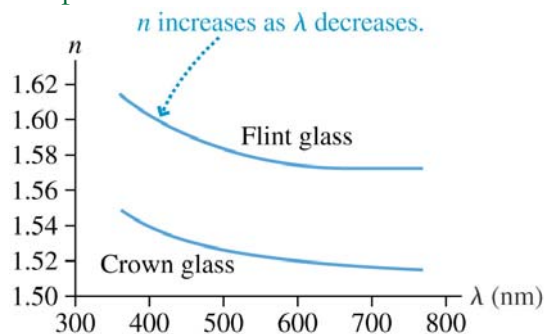

Course Evaluations in Tutorial this week!

- Your chance to officially evaluate Professor Harrison and me is this week during tutorial.
- Your comments will make it into the 2007-08 Anti-Calendar and will form part of my tenure-review in 2009.
- Your participation and honest comments are appreciated – we will read them in the summer after the marks have been submitted.

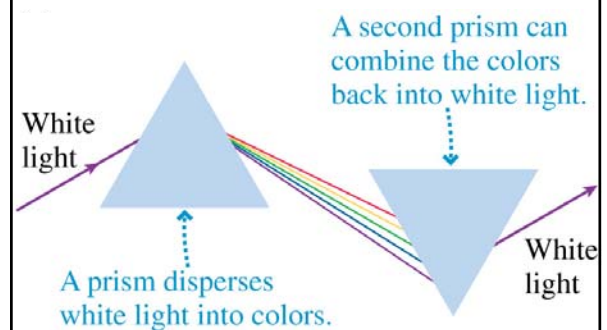

Second Representative Assembly Friday!

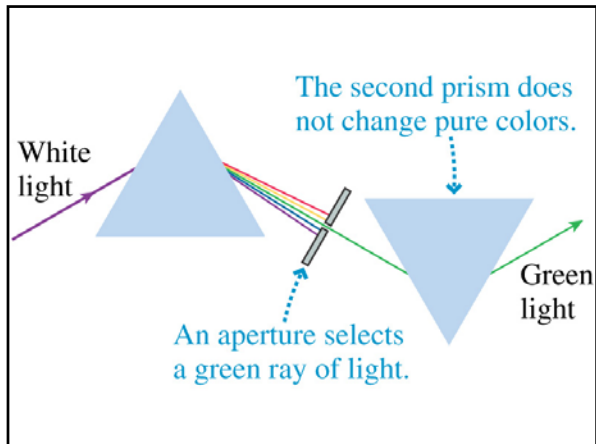

- Friday, Dec. 1 at 2:00 PM in MP222
- One or two “representatives” from each tutorial group are invited. (Please select yourselves during tutorial.)
- Refreshments will be provided!
- I will be there and I'm interested in hearing your thoughts on issues of communication and structure of this course.
- Professor Strong will be there – she's your next prof in this course!

Dispersion

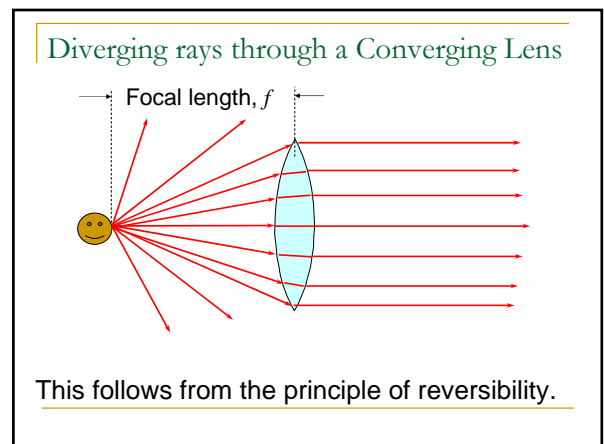

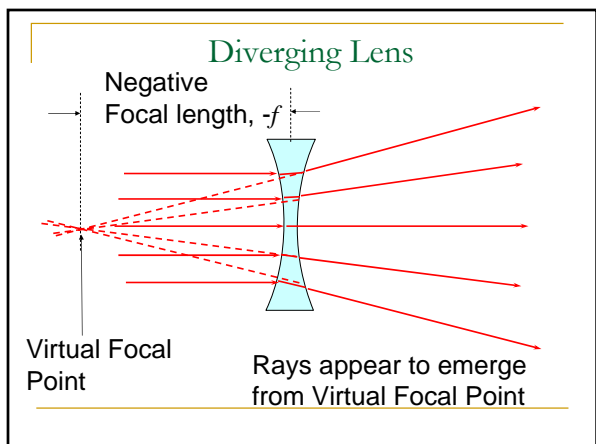

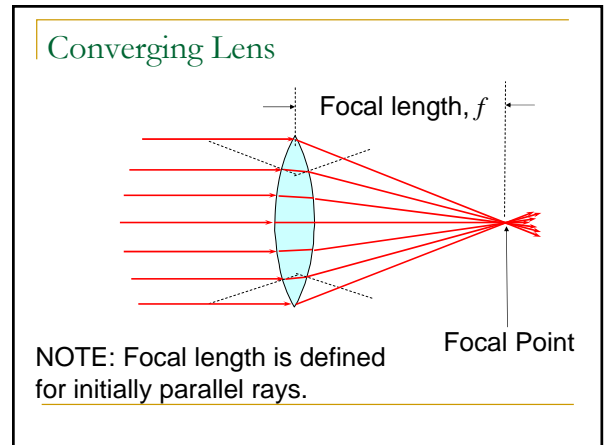

Light going through a prism bends toward the base

Lenses

- Formed by two curved boundaries between transparent media.
- Lenses often have spherical surfaces (lens-maker's equation). The curved surfaces are parts of large spheres of radius R_1 or R_2 .
- **Every** lens shaped like a circle has a diameter, D , and focal length, f .
- The ratio of (f / D) is called "f-number". For example, an "f/6" lens has a focal length of 6 times its diameter.

Diverging rays through a Converging Lens

Thin Lens Equation: $\frac{1}{s} + \frac{1}{s'} = \frac{1}{f}$

Thin Lens Equation: sign conventions

$$\frac{1}{s} + \frac{1}{s'} = \frac{1}{f}$$

s is positive for objects to the left of lens, negative for objects to the right of lens (virtual objects).

s' is positive for images to the right of lens, negative for images to the left of lens (virtual images).

f is positive for converging lenses, negative for diverging lenses.

Lenses used in combination

- If one or more lenses are used in combination, the object of the second lens is the image of the first lens.
- The thin lens equation can be applied to several lenses in sequence, always setting the image of the previous lens to be the object of the next.
