Galilei Symmetries

• time translations: $\delta t = \xi^0$ but not $\delta t = \lambda^i x^i$!

• space translations: $\delta x^i = \xi^i$ i = 1, 2, 3

• spatial rotations: $\delta x^i = \lambda^i{}_j x^j$

N

• Galilean boosts: $\delta x^i = \lambda^i t$

From Galilei to Bargmann

the zero commutator

$$[G_a, P_b] = 0$$

implies that a massive particle with non-zero spatial momentum P_b cannot by any boost transformation G_a be brought to a rest frame \Rightarrow

$$[G_a, P_b] = \delta_{ab} M \quad \rightarrow \quad \text{extra gauge field } m_{\mu}$$

(ロ)、(型)、(E)、(E)、 E、 の(の)

The NC Transformation Rules

The independent NC fields $\{\tau_{\mu}, e_{\mu}{}^{a}, m_{\mu}\}$ transform as follows:

$$\delta \tau_{\mu} = 0,$$

$$\delta e_{\mu}{}^{a} = \lambda^{a}{}_{b} e_{\mu}{}^{b} + \lambda^{a} \tau_{\mu},$$

$$\delta m_{\mu} = \partial_{\mu} \sigma + \lambda_{a} e_{\mu}{}^{a}$$

The spin-connection fields $\omega_{\mu}{}^{ab}$ and $\omega_{\mu}{}^{a}$ are functions of τ_{μ} , $e_{\mu}{}^{a}$ and m_{μ}

Contraction Poincare

 $[P_A, M_{BC}] = 2 \eta_{A[B} P_{C]}, \quad [M_{AB}, M_{CD}] = 4 \eta_{[A[C} M_{D]B]}$

$$P_0 = \frac{1}{2\omega}H, \qquad P_a = P_a, \qquad A = (0, a)$$
$$M_{ab} = J_{ab}, \qquad M_{a0} = \omega G_a$$

Taking the limit $\omega \rightarrow \infty$ gives the Galilei algebra:

$$\left[P_{a}, M_{b0}\right] = \delta_{ab}P_{0} \qquad \Rightarrow \qquad \left[P_{a}, G_{b}\right] = 0$$

n Geometry	Newton-Cartan Gravity	Non-Relativistic Matter	Comments
	000000	00000000	00

Contraction Poincare \otimes U(1)

$$\left[P_A, M_{BC}\right] = 2 \eta_{A[B} P_{C]}, \quad \left[M_{AB}, M_{CD}\right] = 4 \eta_{[A[C} M_{D]B]} \quad \text{plus} \quad \mathcal{Z}$$

$$P_0 = \frac{1}{2\omega} H + \omega Z, \qquad \qquad \mathcal{Z} = \frac{1}{2\omega} H - \omega Z, \qquad \qquad A = (0, a)$$
$$P_a = P_a, \qquad \qquad M_{ab} = J_{ab}, \qquad \qquad M_{a0} = \omega G_a$$

Taking the limit $\omega \rightarrow \infty$ gives the Bargmann algebra including Z:

$$\left[P_{a}, M_{b0}\right] = \delta_{ab}P_{0} \qquad \Rightarrow \qquad \left[P_{a}, G_{b}\right] = \frac{\delta_{ab}Z}{\delta_{ab}Z}$$

The NC Limit I

Dautcourt (1964); Rosseel, Zojer + E.B. (2015)

 $\begin{array}{ll} \mbox{STEP I:} & \mbox{express relativistic fields } \{E_{\mu}{}^{A}, M_{\mu}\} \mbox{ in terms of non-relativistic fields } \{\tau_{\mu}, e_{\mu}{}^{a}, m_{\mu}\} \end{array}$

$$E_{\mu}^{0} = \omega \tau_{\mu} + \frac{1}{\omega} m_{\mu}, \qquad M_{\mu} = \omega \tau_{\mu}, \qquad E_{\mu}^{a} = e_{\mu}^{a}$$

constraint : $\partial_{[\mu}\tau_{\nu]} = 0$

N.B. PN approximation uses
$$E_{\mu}^{0} = \omega \tau_{\mu} + \frac{1}{\omega} n_{\mu}$$
 and no M_{μ}

The NC Limit II

STEP II: substitute the expressions into the transformation rules and the e.o.m. and take the limit $\omega \rightarrow \infty \Rightarrow$

- the NC transformation rules are obtained and agree with the gauging procedure
- the NC equations of motion are obtained

Note: the standard textbook limit gives Newton gravity

Newton-Cartan Gravity

Non-Relativistic Matter

Comments

00

The NC Equations of Motion

The NC equations of motion are given by

Élie Cartan 1923

$$\mathcal{R}_{0c}{}^{c}(G) = \mathcal{R}_{0c}{}^{ca}(J) = \mathcal{R}^{(a}{}_{c}{}^{cb)}(J) = 0$$

$$1 \qquad a \qquad (ab)$$

there is no known action that gives rise to these equations of motion

• after gauge-fixing $\tau_{\mu} = \delta_{\mu,0}$, $e_{\mu}{}^{a} = \delta_{\mu}{}^{a}$ and $m_{0} = \Phi$ the 4D NC e.o.m. reduce to $\Delta \Phi = 0$

The 'force limit' of spin 0

$$\frac{1}{c^2}\ddot{\Phi} - \nabla^2 \Phi + \left(\frac{mc}{\hbar}\right)^2 \Phi = 0$$

Take the non-relativistic limit $c \to \infty$ keeping $\lambda = \hbar/mc$ fixed \to

$$abla^2 \Phi = rac{1}{\lambda^2} \Phi$$

no massive spin 0 particle!

N.B. The limit can also be taken in an arbitrary background

Newton-Cartan	Geometry
0000000

Comments

00

The 'particle limit' of complex spin 0

$$\frac{1}{c^2}\ddot{\Theta} - \nabla^2 \Phi + \left(\frac{mc}{\hbar}\right)^2 \Phi = 0$$

To avoid infinities we redefine

$$\Phi = e^{-\frac{i}{\hbar}(mc^2)t}\Psi$$

so that the Klein-Gordon equation becomes

$$-\frac{1}{2mc^2}\left(i\hbar\frac{d}{dt}\right)^2\Psi-i\hbar\dot{\Psi}-\frac{\hbar^2}{2m}\nabla^2\Psi=0$$

and the $c \to \infty$ limit yields the Schrödinger equation

$$i\hbar\dot{\Psi}+\frac{\hbar^2}{2m}\nabla^2\Psi=0$$

Towards Interactions: special features of 3D

J. Rosseel, P. Townsend + E.B., work in progress

• 'taking the square-root':

 $\Box - m^2 = O(m)O(-m)$ with $[O(m)]_{\mu}{}^{
ho} = \epsilon_{\mu}{}^{ au
ho}\partial_{ au} + m\delta_{\mu}{}^{
ho}$

• 'boosting up the derivatives':

$$\partial^{\mu}A_{\mu} = 0 \quad \rightarrow \quad A_{\mu} = \epsilon_{\mu}{}^{\nu\rho}\partial_{\rho}B_{\sigma}$$

'CS-like' formulation:

$$L = \frac{1}{2}g_{rs}a^{r} \cdot da^{s} + \frac{1}{6}f_{rst}a_{r} \cdot \left(a^{s} \times a^{t}\right) \qquad r = 1, \cdots, N$$

take real limit or complex limit followed by self-duality truncation?

00

Non-relativistic 3D Chern-Simons Like Gravity

- The 3D Galilei and Bargmann algebras do not allow an invariant bilinear form
- Precisely in 3D there exists a so-called Extended Bargmann Algebra with two central extensions and an invariant bilinear from. The second central extension is related to spin

Jackiw, Nair (2000)

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

 can one use two such algebras to construct a CS-like bi-metric gravity theory describing the non-linear dynamics of a massive spin 2 particle instead of a massive deformation of Poisson's equation?
