PHY131H1F - Hour 28

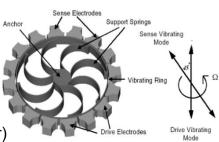

Today:

1

We finish up Chapter 9!

9.5 Rotational Kinetic Energy

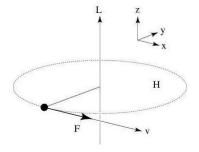

(let's skip 9.6 on Tides and Earth's day this semester)

PollQuestion

A person spins a tennis ball on a string in a horizontal circle (so that the axis of rotation is vertical). At the point indicated below, the ball is given a sharp blow in the forward direction. This causes a change in rotational momentum dL in the

- A. x-direction
- B. y-direction
- C. z-direction

Rotational momentum of an isolated system is constant

 If the net torque that external objects exert on a turning object is zero, or if the torques add to zero, then the rotational momentum *L* of the turning object remains constant:

 $L_{\rm f} = L_{\rm i}$ or $I_{\rm f} \omega_{\rm f} = I_{\rm i} \omega_{\rm i}$ (Eq. 9.13 from Etkina, pg.268)

TIP Rotational momentum is sometimes called angular momentum.

3

Demonstration 1

- Which has greater rotational inertia, I:
- A. Chair + Harlow + two 5 kg masses, arms outstretched
- B. Chair + Harlow + two 5 kg masses held near chest
- Assume external torque = zero, so $L = I \omega$ is constant.
- Harlow begins rotating at some particular value of ω is with his arms outstretched.
- He then brings the masses in to his chest.
- How does this affect the rotation speed ω ?

Demonstration 2

- Harlow is not rotating. He is holding a bicycle wheel which is rotating counterclockwise as viewed from above. What is the direction of the rotational momentum of the chair + Harlow + bicycle wheel system?
- A. Up
- B. Down
- Assume no external torque. If Harlow flips the wheel upside down, it is now rotating clockwise as viewed from above. The rotational momentum of the wheel is now down. What happens to Harlow+chair?

5

Demonstration 1 Recap

- Harlow begins rotating at some particular value of ω is with his arms outstretched. *I* is large, ω is small, $L = I \omega$ is some value.
- He then brings the masses in to his chest. *I* decreases.
- But there is no external torque, so $L = I \omega$ value must stay the same.
- So ω is increases.

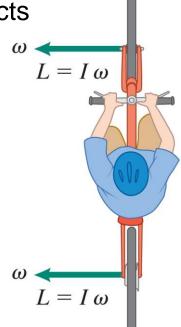

Demonstration 2 Recap

- Harlow is not rotating. He is holding a bicycle wheel which is rotating counterclockwise as viewed from above.
- Rotational momentum of the system is up.
- Harlow flips the wheel upside down, so its rotational momentum is now down.
- No external torques, so the rotational momentum of the system must still be up.
- Harlow + chair rotate counterclockwise.

7

Stability of rotating objects

- If the rider's balance shifts a bit, the bike + rider system will tilt and the gravitational force exerted on it will produce a torque.
 - The rotational momentum of the system is large, so torque does not change its direction by much.
 - The faster the person is riding the bike, the greater the rotational momentum of the system and the more easily the person can keep the system balanced.

A 20-cm-diameter, 2.0 kg solid disk is rotating at	REPRESENT MATHEMATICALLY
200 rpm. A 20-cm-diameter, 1.0 kg circular loop is	
dropped straight down onto the rotating disk.	
Friction causes the loop to accelerated until it is	
"riding" on the disk. What is the final angular	
speed of the combined system?

Rotational Kinetic Energy

A rotating rigid body has kinetic energy because all atoms in the object are in motion. The kinetic energy due to rotation is called **rotational kinetic energy**.

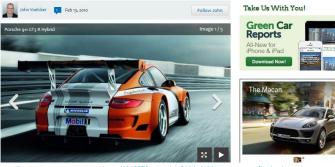

$$K_{\rm rot} = \frac{1}{2}I\omega^2$$

Flywheels for storing and providing energy

- In a car with a flywheel, instead of rubbing a brake pad against the wheel and slowing it down, the braking system converts the car's translational kinetic energy into the rotational kinetic energy of the flywheel.
- As the car's translational speed decreases, the flywheel's rotational speed increases. This rotational kinetic energy could then be used later to help the car start moving again.

Porsche 911 Hybrid Test Car Uses Flywheel To Store Energy

11

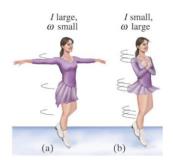

Poll Question

A figure skater stands on one spot on the ice (assumed frictionless) and spins around with her arms extended.

When she pulls in her arms, she reduces her rotational inertia and her angular speed increases.

Compared to her initial rotational kinetic energy, her rotational kinetic energy after she has pulled in her arms must be:

- A. the same because no work is done on her.
- B. larger because she's rotating faster.
- C. smaller because her rotational inertia is smaller.

Complete Linear / Rotational Analogy Chart

- Linear • $\vec{s}, \vec{v}, \vec{a}$ • θ, ω, α
- Force: \vec{F}
- Torque: τ

Rotational Analogy

• Rotational Inertia: I

- Mass: *m*
- Newton's $\frac{2^{\text{nd}} \text{ law:}}{a} = \frac{\vec{F}_{net}}{a}$
- Kinetic energy: $K_{\text{tran}} = \frac{1}{2}mv^2$
- Momentum: $\vec{p} = m\vec{v}$

$$K_{\rm rot} = \frac{1}{2}I\omega^2$$

 $\alpha = \frac{\tau_{net}}{I}$

 $\vec{L} = I\vec{\omega}$

13

A 0.50 kg basketball rolls along the ground at 1.0 m/s. What is its *total* kinetic energy (translational plus rotational)? [Note that the rotational inertia of a hollow sphere is $I = 2/3 MR^2$.]

SIMPLIFY & DIAGRAM

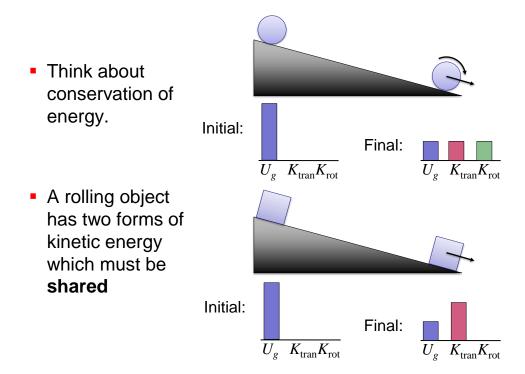

Summary of some Different Types of Energy:

- Kinetic Energy due to bulk motion of centre of mass: $K = \frac{1}{2} mv^2$ (Sometimes called Translational Kinetic Energy K_{tran})
- Gravitational Potential Energy (System = object + Earth): U_g = mgy
- Spring Potential Energy (system = object + spring): $U_s = \frac{1}{2} kx^2$
- Rotational Kinetic Energy: $K_{\rm rot} = \frac{1}{2} I \omega^2$
- Internal Thermal Energy: ΔU_{int} (If the system includes two surfaces rubbing against each other, then $\Delta U_{int} = |f_k d|$)
- A system can possess any or all of the above.
- One way of transferring energy in or out of a system is work:
- Work done by a constant force: $W = Fd\cos\theta$

- A solid disk is released from rest and rolls without slipping down an incline. A box is released from rest and slides down a frictionless incline of the same angle. Which reaches the bottom first?
- A: disk wins
- B: box wins
- C: tie

Before Class 29 on Wednesday

- Please start reading Chapter 10:
- 10.1 Period and Frequency
- 10.2 Simple Harmonic Motion

 We've now finished Chapters 8 and 9 on Rotation and Torque Stuff.

 Next class we will start in on Chapters 10 and 11, which are on Vibrations and Waves!

• Midterm Assessment 5 on Dec. 1 is on Chs. 9 and 10.

• Chapter 11 is the last chapter we will study in this course before the final exam on Dec.17.
